HOW TO BUMP FIRE A AK-47

Do not put the stock against your shoulder. Hold it underneath your arm. (see photo)

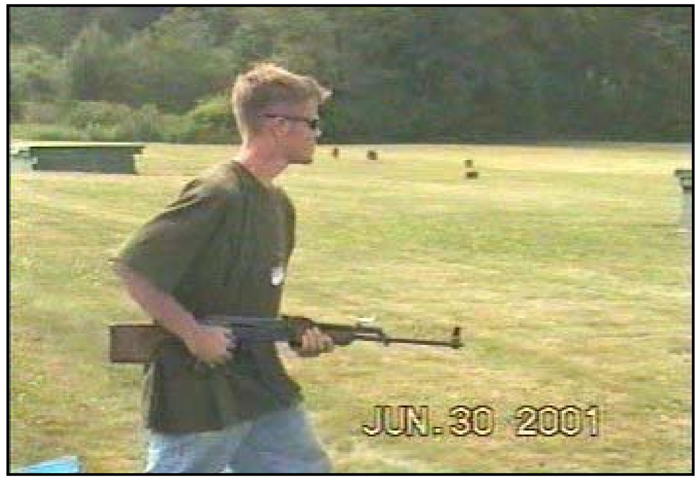

Keep your index finger on the trigger, and hold it steady and stiff, as well as your right arm.

With the left arm, pull the AK forward, against your trigger finger. Hold your finger and right arm firm, so the trigger can be pulled. Keep the rest of your right hand off the grip, fingers hanging in the air.

Keep the forward pull of the AK as steady as possible, and you'll be squeezing off rounds rapid-fire.

Think of it this way: instead of pulling the trigger to shoot, pull the gun forward to shoot. Maintaining the steady forward pull during shooting makes it seem like it's going full auto.

Careful though. When I do it, the barrel tends to drift DOWN instead of climbing like a normal full auto.

You don't pull the trigger; you pull the rifle into the trigger finger, which is in a fixed position. That's the hard part to master. Keeping the trigger finger fixed while applying the proper forward pressure to both allow the recoil to happen yet correct for the backward thrust generated by the discharge in such a manner as to allow the trigger to reset and fire the next round in a smooth timing which simulates full auto fire.

Don't worry. After three or four short bursts you should be able to feel what needs to happen. Take lots of ammo and try to find a secluded area to shoot at.

Enclosed are 3 mpeg files of people bump firing their AK. They are located on the CD in a directory called BumpMovies. You will need the Windows media player, Flash, QuickTime or some program that will let you run MPEG Files. As a bonus, there is a MPEG file of an AK Auto being shot so much, the hand-guard starts to smoke.
